HBM / SYSMEX · S/4HANA · WRICEF · WORK STREAM PTP · PACKAGE ZPTP_SPLIT_VAL

Stocks & Batches Migration Program

Split Valuation, Phase 1. Moves unrestricted stock and batches from the existing plant to the new split-valuated plant, with full validation, simulation, restart and an audit log.

1 Overall purpose

Plant 8Q01 is created with split valuation active. The existing unrestricted stock of 8P01 has to land there with the right valuation type on every material and batch, without double issues, orphan batches or untraceable postings.

The WRICEFs cover the whole chain:

- build the HBM Valuation Type Input File from SAP stock;
- extend the batches to 8Q01 with the source attributes and the target valuation type;
- post one 301 document per file line, one item per issuing storage location, received in the mapped storage location of 8Q01;
- reconcile file against SAP stock, then log every line and every batch for audit, reprocessing and sign-off.

Movement	301 · one-step plant-to-plant · GM code 04
Stock scope	Unrestricted only (MCHB-CLABS / MARD-LABST)
Out of scope	QI, blocked, special stock · batch classification
Materials	Batch-managed and non-batch (NO_BATCH)
Option 1	Split valuation materials, file-driven
Option 2	Non split materials not in the file, whole stock
Zero stock	P_ZBAT: batch created in 8Q01 although the 8P01 stock is 0, no movement
Units	External units converted with micro sign / Greek mu variants (µg, µL); local file decoded as UTF-8
Result list	ALV grouped by status, sorted by message, material, batch · red E / A / I, yellow W, green T / S
Modes	Full validation · Direct transfer (option 1) · Simulation (TESTRUN) · Restart by RUN_ID
Messages	Class ZPTP_SPLIT_VAL (002–026)

2 ABAP programs developed

PREPARE THE FILE

ZPTP_SPLIT_VAL_MIG_UTILITY

Input file generator

Reads unrestricted stock of 8P01 per material and batch, picks the valuation type of 8Q01 (first in ascending order) and downloads the CSV `MATNR;CHARG;BWTAR;QUANTITY;UOM`. ALV shows every line kept or left out, with the reason.

`Test mode` `ALV only`

STAGE THE FILE

ZPTP_SPLIT_VAL_MIG_UPLOAD

PC → application server

Copies the input file byte for byte from the PC to the application server, so the migration can run as a background job. Dialog only; asks before overwriting.

`Binary copy` `Dialog`

BATCH MASTER (OPTIONAL)

ZPTP_SPLIT_VAL_BATCH_COPY

Batch copy 8P01 → 8Q01

Reads an Excel file (material; batch; valuation type) and creates the batches at plant level in 8Q01 with the source attributes and the file's valuation type. No stock movement.

`Test mode` `ALV, no DB log`

MIGRATE

ZPTP_SPLIT_VAL_MIG

Stock & batch migration engine

Validates the file against SAP (valuation segment, quantities, units, NO_BATCH, storage-location mapping), creates missing target batches (also zero-stock ones with P_ZBAT), allocates per storage location and posts the 301 movements. Option 2 moves the whole stock of every 8P01 material absent from the file, if it is not split-valuated in 8Q01. Logs every record.

`Simulation` `RUN_ID restart` `Logged` `2 options`

3 Custom transactions

Four developed (SE93, report transactions, screen 1000), grouped in the area menu ZPTP_SVAL_MENU (*Manage stock transfers 8P01->8Q01*; the three utilities under *Utilities*). The migration run is scheduled as a background job (SM36).

CODE	USE
ZPTP_SPLIT_VAL_MIG	Migration report (dialog); to add to the roles (S_TCODE)
ZPTP_SPLIT_VAL_BCPY	Batch copy 8P01 → 8Q01 (ZPTP_SPLIT_VAL_BATCH_COPY); to add to the roles (S_TCODE)
ZPTP_SPLIT_VAL_UPLD	File upload PC → server (ZPTP_SPLIT_VAL_MIG_UPLOAD); to add to the roles (S_TCODE)
ZPTP_SPLIT_VAL_UTIL	Input file generator (ZPTP_SPLIT_VAL_MIG_UTILITY); to add to the roles (S_TCODE)
SM30	Maintain ZPTP_SLOC_MAP
SE16	Read the log tables by RUN_ID
CG3Z	Standard alternative to the UPLOAD report (text mode)

Roles: the transactions must be added to the migration team role (S_TCODE). A stricter report-level authorization object is still open with the security team.

4 Customizing before the run

TABLE	WHAT TO SET	BLOCKS WITH
ZPTP_SLOC_MAP custom · SM30	One entry per 8P01 storage location holding stock: 8P01 / SLoc → 8Q01 / SLoc. Several sources may map to one target. Delivery class C, transported.	024
T001L OX09	Every mapped target storage location exists in 8Q01	023
T001W	Plant 8Q01 exists, valuation level = plant	screen
T149* OMWC	Split valuation active in 8Q01 with the valuation types used in the file (option 2: not active for the material)	003 / 025
MARV / T001B MMPV · OB52	Posting period of P_BUDAT open in both plants	BAPI

Master data to check as well: materials extended to 8Q01 with an MBEW segment per valuation type (003, 014); batch management identical in both plants (013, 026); units of measure (T006A) existing in the logon language (017).

5 Log tables to analyze

TABLE	GRAIN	KEY	READ FOR
ZPTP_MOV_EXEC Movement execution log	One row per input line and per issuing storage location	RUN_ID · RUN_SEQ · POSNR	Status, material / batch, plants and storage locations, valuation type, SAP stock vs file quantity and variance, material document (MBLNR / MJAHR), message class / number / text
ZPTP_BATCH_EXT Batch extension log	One row per batch handled in 8Q01	RUN_ID · RUN_SEQ · MATNR · CHARG · WERKS_DST	Batch created, already existing (ALREADY_EXIST), simulated or failed, with the BAPI message

S Posted **E** Error / blocked **W** Warning **T** Simulated **Z** Zero quantity **X** Skipped, not in file **I** Inconsistent: SAP stock not in file, segment exists

Sign-off check: no status E left in the last RUN_SEQ of the real run. P_REPRC reprocesses E lines of the previous sequence; status I needs a completed file and a full run. A run holding real postings cannot be deleted with P_DEL. UTILITY and BATCH_COPY write no log table; their result is the ALV list.
